Irrigation Audits

Save 20% on your water bill

A recently passed Minnesota law requires public water utilities to implement residential and commercial rate structures that encourage water conservation. The cost per unit increases as water use increases within specified "blocks" or volumes.

With rising prices and increased regulation of water, it is becoming imperative that property and home owner associations identify any and all inefficiencies in their irrigation systems.

For existing irrigation systems, audits can reveal system inefficiencies which can help identify conservation opportunities. Investing in new products and technologies that use water more efficiently will reduce your water use and save money.
